

Create a program to update the required Algebra entrance test scores for Anywhere Community College. The spreadsheet named Entrance Test Scores (also attached to this assignment) contains a list of academic programs in which the Algebra test scores have changed. Since this spreadsheet was created, academic department chairs have increased the entrance test score for algebra to be 66 for AAS.AOT, reduced the algebra score for CT.COM to 44 and reduced the algebra score for CT.PPL to 44. Write a Python program to access the Entrance Test Scores spreadsheet, update the test score, and then create a new spreadsheet called updatedScores. Create a dictionary for the test score updates and update the scores via a loop, increasing the row number to include all the rows in the spreadsheet. You can either hard code the dictionary into your program or import from a separate Python module. Do not change the formatting of the original spreadsheet. Include some sort of user input validation.

Save your program as Entrancexxxxxx where xxxxx is your last name. Submit your program to D2L under Entrance Test program assignment.

Points awarded as below:	Points
Use of dictionary	30
Loop to read through the rows of the spreadsheet	20
Updated spreadsheet is created	20
Comments	20
Program runs	10
Total:	100
